

Effects of Pornography on Adolescents

Pornography has significant effects during all stages of family life. For a child exposed to pornography within a family setting, pornography causes stress and increases the risk for developing negative attitudes about the nature and purpose of human sexuality.

For adolescents who view pornography, their attitudes toward their own and others' sexuality change, and their sexual expectations and behavior are shaped accordingly.

1. Effects on Children

The impact of a parent's use of pornography on young children is varied and disturbing. Pornography eliminates the warmth of affectionate family life, which is the natural social nutrient for a growing child. Other losses and traumas related to the use of pornography when a child is young include:

- encountering pornographic material a parent has acquired;
- encountering a parent masturbating;
- overhearing a parent engaged in "phone sex";
- witnessing and experiencing stress in the home caused by online sexual activities;
- increased risk of the children becoming consumers of pornography themselves;
- witnessing and being involved in parental conflict;
- exposure to the commodification of human beings, especially women, as "[sex objects](#)";
- increased risk of parental job loss and financial strain;
- increased risk of [parental separation and divorce](#);
- decreased parental time and attention—both from the pornography-addicted parent and from the parent preoccupied with the addicted spouse.¹⁾

Also, parents may disclose their struggle with the addiction to pornography to their children, intentionally or unintentionally, thereby distorting their children's sexual development.²⁾

2. Effects on Teenagers

[Pornography viewing](#) among teenagers disorients them during that developmental phase when they have to learn how to handle their sexuality and when they are most vulnerable to uncertainty about their sexual beliefs and moral values.³⁾ A study of 2,343 adolescents found that sexually explicit Internet material significantly increased their uncertainties about sexuality.⁴⁾ The study also showed that increased exposure to sexually explicit Internet material increased favorable attitudes toward [sexual exploration with others outside of marriage](#) and decreased marital commitment to the other spouse.⁵⁾ Another study by Todd G. Morrison, professor of psychology at the University of Saskatchewan, and colleagues found that adolescents exposed to high levels of pornography had lower levels of sexual self-esteem.⁶⁾

A significant relationship also exists between frequent pornography use and feelings of loneliness, including major depression.⁷⁾

Finally, viewing pornography can engender feelings of shame: In a study of high school students, the

majority of those who had viewed pornography felt some degree of shame for viewing it. However, 36 percent of males and 26 percent of females said they were never ashamed of viewing pornography,⁸⁾ giving some idea of the [level of desensitization](#) already reached in society.

High adolescent consumption of pornography also affects behavior. Male pornography use is linked to significantly increased sexual intercourse with non-romantic friends,⁹⁾ and is likely a correlate of the so-called “hook-up” culture.

Exposure to pornographic sexual content can be a significant factor in teenage pregnancy. A three year longitudinal study of teenagers found that frequent exposure to televised sexual content was related to a substantially greater likelihood of teenage pregnancy within the succeeding three years. This same study also found that the likelihood of teenage pregnancy was two times greater when the quantity of that sexual content exposure, within the viewing episodes, was high rather than low.¹⁰⁾

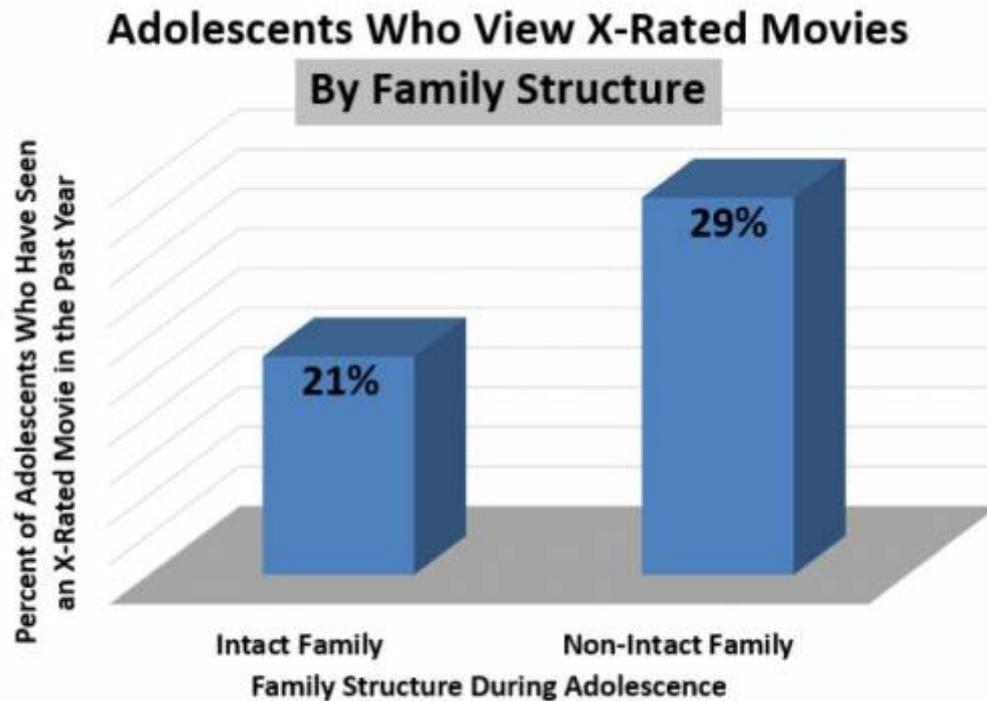

3. Parental Involvement

Although U.S. adolescents indicate their preferred source of sexual information is their parents, more than half of them report they have learned about intercourse, pregnancy, and birth control from [television](#), and half of teenage women report they first learned about intercourse from magazines.¹¹⁾

A study of 1,300 eight- to thirteen-year-old girls found that, among those who engaged in “cybersex,” 95 percent of the parents were completely unaware of their children’s involvement.¹²⁾ Compared to adolescents who do not search for pornography online, adolescents who search for pornography online are about three times as likely to have parents who do not monitor their behavior at all (or very little). Compared to those who do not seek out pornography, those who seek Internet pornography are three times as likely to give a poor rating of their attachment to their parent.¹³⁾

3.1 Related American Demographics

According to the General Social Survey, adults who grew up living with both biological parents are less likely to have viewed an X-rated movie in the last year.¹⁴⁾ (See [Chart](#))

¹⁴⁾ This chart draws on data collected by the General Social Survey, 1972-2006. From 1972 to 1993, the sample size averaged 1,500 each year. No GSS was conducted in 1979, 1981, or 1992. Since 1994, the GSS has been conducted only in even-numbered years and uses two samples per GSS that total approximately 3,000. In 2006, a third sample was added for a total sample size of 4,510.
